PHY 166, Fall 2021, TEST 3 - Practice 3 points maximum for each problem, 15 points maximum for the whole.

1. In a hydraulic system, a student of mass $m$ is standing on one of the movable pistons that is a circle of diameter $d$. (a) What is the pressure in the hydraulic fluid? (b) What is the magnitude of the force exerted on another movable piston that is a circle of diameter $D$ ?
2. A mass $m$ of a metal with heat capacity $c_{M}$ at initial temperature $T_{M}$ is added to the volume $V$ of a liquid with density $\rho$ and heat capacity $c_{L}$ at initial temperature $T_{L}$. What is the final temperature of the system?
3. The liquid in a horizontal pipe of diameter $d_{1}$ before a constriction is at pressure $P_{1}$ and flowing with the speed $v_{1}$, and then in the constriction with diameter $d_{2}$ the gauge measures pressure $P_{2}$. What is the density $\rho$ of the liquid?
4. A body of a rectangular shape has sides $a_{0}, b_{0}$, and $c_{0}$ at temperature $T_{0}$. What will be the volume at temperature $T$ if the coefficient of linear expansion is $\alpha$ ?
5. A storage tank contains mass $M$ of oxygen $\left(\mathrm{O}_{2}\right)$ at an absolute pressure of $P$ and temperature $T$. Another tank of the same volume contains the same mass of $\mathrm{CO}_{2}$ at the same pressure. What is the temperature in the $\mathrm{CO}_{2} \operatorname{tank}$ ? (The combined numbers of protons and neutrons in atoms of C and O are 12 and 16 , respectively. Do not use moles!).
